

LOW DENSITY PAPER SHEET AND TUBE  
INCORPORATING THE SAME

ABSTRACT OF THE DISCLOSURE

5           The present invention provides a low-density paperboard sheet of at least one  
paperboard layer made from a stock solution that includes a proportion of standard wood  
flour or fine sawdust in addition to traditional cellulose fibers. The proportion of sawdust  
can range from 1% to 40% by weight. Advantageously the sawdust of the present  
invention does not require a costly refining or micronization operation in order to  
10       produce low-density, high yield paperboard layers. Additionally, the low-density layers  
of the present invention may be readily combined with other layers of varying densities in  
order to tailor the physical properties of the resulting multi-layer sheet to a given  
application.
